

MODULAR TILT HANDLING SYSTEM

ABSTRACT OF THE DISCLOSURE

A modular tilt handling system for controlling how tilts are declared, displayed and cleared in a gaming machine. The modular tilt handling system includes a plurality of gaming software elements that allow the gaming system to detect events and to generate one or more tilts in response to the one or more events in accordance with the regulations of a gaming jurisdiction. The modular tilt handling system treats events separately from tilts so that tilts can be dynamically configured for different gaming jurisdictions.
